HUMMINGBIRD

#JooBam

KIDDISVIT

The hummingbird's heart is three times bigger than their stomach and takes up more than a third of the bird's body size.

HUMMINGBIRD

Hummingbirds are a family of small birds that includes more than 350 species.

They have bright feathers, often with metallic sheen. The color of their feathers changes under different lighting conditions. Some hummingbirds may have a crest or a special collar. The size of the family representatives ranges from 6 to 22 cm. The length of a bee-hummingbird is only 62 mm — they are the smallest birds on the planet.

Hummingbirds are widespread in tropical forests. They feed on the sweet nectar of flowers, drink tree sap and consume pollen.

GLOW IN THE DARK

To make the toys glow in the dark, you need to hold them in the sun or under a lamp for a few minutes.

CHANGE COLOR IN WARM WATER

To make the characters change their colors, you need to put the toy in water at a temperature above 30–32 degrees.

EQUATORIAL ANIMALS

TOUCAN

#boobam

KIDDISVIT

The iris of the toucan's eye can vary from black to blue and green color.

TOUCAN

Toco toucan is the largest member of the toucan family.

It has unusual feathers: the body is black, the breast and upper tail are white, and the lower tail is red. Toucan has a giant yellow-orange beak with a black spot on the end. It looks heavy, but the beak is hollow inside. Toucans use it to get food, peel fruit, and ward off predators.

Toco toucans are common in South America. They live in pairs or small groups. They eat fruit, sometimes insects.

GLOW IN THE DARK

HOOPOE

#JooBam

KIDDISVIT

Hoopoe loves to sunbathe and take dust baths.

HOOPOE

Hoopoe is a small bird of the rhinoceros family.

It is brightly colored with black and white wing and tail. The color of the head, neck and breast varies from pink to brown, depending on the subspecies. The bird has a long, narrow beak and an orange crest, which opens in a fan-like shape, with black coloring at the tips of the feathers.

It lives in open areas with single shrubs or trees, and is found in orchards and vineyards. It feeds on small invertebrates: insects, larvae, spiders.

EQUATORIAL ANIMALS

SEAHORSE

#boobam

KIDDISVIT

Dwarf seahorses are the slowest fish in the world. They move at a speed of up to 1.5–2 m/h in calm water.

SEAHORSE

Seahorses are a family of small marine fish.

They have long spines and skin bumps on their bodies — that makes them invisible among the algae.

Seahorses are 2–30 cm long. Their dorsal fin makes 30 movements per second on average.

They lead an inactive lifestyle: they attach themselves to plants with their flexible tails and change their body color to blend in with the background. They feed on small crabs and shrimps. Seahorses have no stomach, so they have to feed continuously throughout their lives.

SIZE:

BRIGHTNESS:

EQUATORIAL ANIMALS

MANTA RAY

#Jabbaram

KIDDISVIT

They can make mental maps of the world around them based on smells and visual landmarks.

MANTA RAY

Manta is a marine giant, the largest and safest of the stingrays.

From Spanish, "manta" means "cloak" or "blanket". Manta gets its second name — "sea devil" — for its main fins, which roll into a tube while swimming and look like horns.

Manta rays are found in tropical waters of all oceans. They feed on plankton, maggots, and very small fish. They filter them by swimming with their mouths wide open: they strain the water, leaving the food in their mouths.

EQUATORIAL ANIMALS

**MOORISH
IDOL**

#Jabbaram

KIDDISVIT

Narrow elongated mouth and backward-curved teeth help the fish to pull invertebrates out of reef cracks.

MOORISH IDOL

Moorish idol is a fish species whose name comes from the Greek word "zagkios", which means "slanted".

The fish reaches 22 cm in length, and its body height can be up to 1.4 times its length.

Moorish idol inhabits tidal lagoons, rocky and coral reefs, preferring areas with a hard bottom at a depth between 3 and 180 meters. It is usually found in small groups of up to three individuals, rarely in schools.

They feed on sponges, mosses, coral polyps, other invertebrates and seaweed.

SIZE:

CLOWNFISH

#JooBam

KIDDISVIT

Despite their small size and beauty, the fish are quite aggressive: they can bite and pinch.

CLOWNFISH

Clownfish is a colorful underwater inhabitant.

This unusual name is the outcome of its various coloring and restless behavior. The color of the fish can vary from purple to orange and yellow.

Clownfish prefer to live among actinia — coral polyps that kill those inhabitants of ocean waters who were careless enough to swim too close and touch them. The fish do not like to move away from their habitat, so their diet includes various types of plankton and small seaweed brought by the current.

EQUATORIAL ANIMALS

FUGU

#boobam

KIDDISVIT

There is a connection between the color of the body and the amount of poison produced by the fish.

FUGU

Fugu is a small fish that is only the size of your palm. Instead of scales, it has thin, elastic skin. If the fugu is frightened, it will instantly swell up and take on the shape of a ball covered with sharp spikes. In this state, the fish is 3 times larger than its original size.

It lives in waters up to 100 meters deep. Adult fish prefer bays, sometimes entering brackish waters. It feeds on living organisms found at the bottom of seas and oceans.

SIZE:

BRIGHTNESS:

SPECIAL FEATURE:

almost all species of fugu fish have venom

EQUATORIAL ANIMALS

OCTOPUS

#doodbam

KIDDISVIT

Octopuses can be trained and can distinguish between people and geometric shapes.

OCTOPUS

Octopuses are the most famous family of cephalopods. The body of octopus is short and soft. The mollusk has eight long tentacles – “arms” with 2000 suckers on them. Octopuses have an unusual ability: due to the absence of a skeleton, they can change shape.

Most octopuses are mostly bottom-dwelling creatures, but some species live in the water column. They prefer coastal areas, caves and crevices in rocks.

They feed on mollusks, shellfish, and fish. The octopus captures its prey with all tentacles, holding it with suction cups.

SIZE:

EQUATORIAL ANIMALS

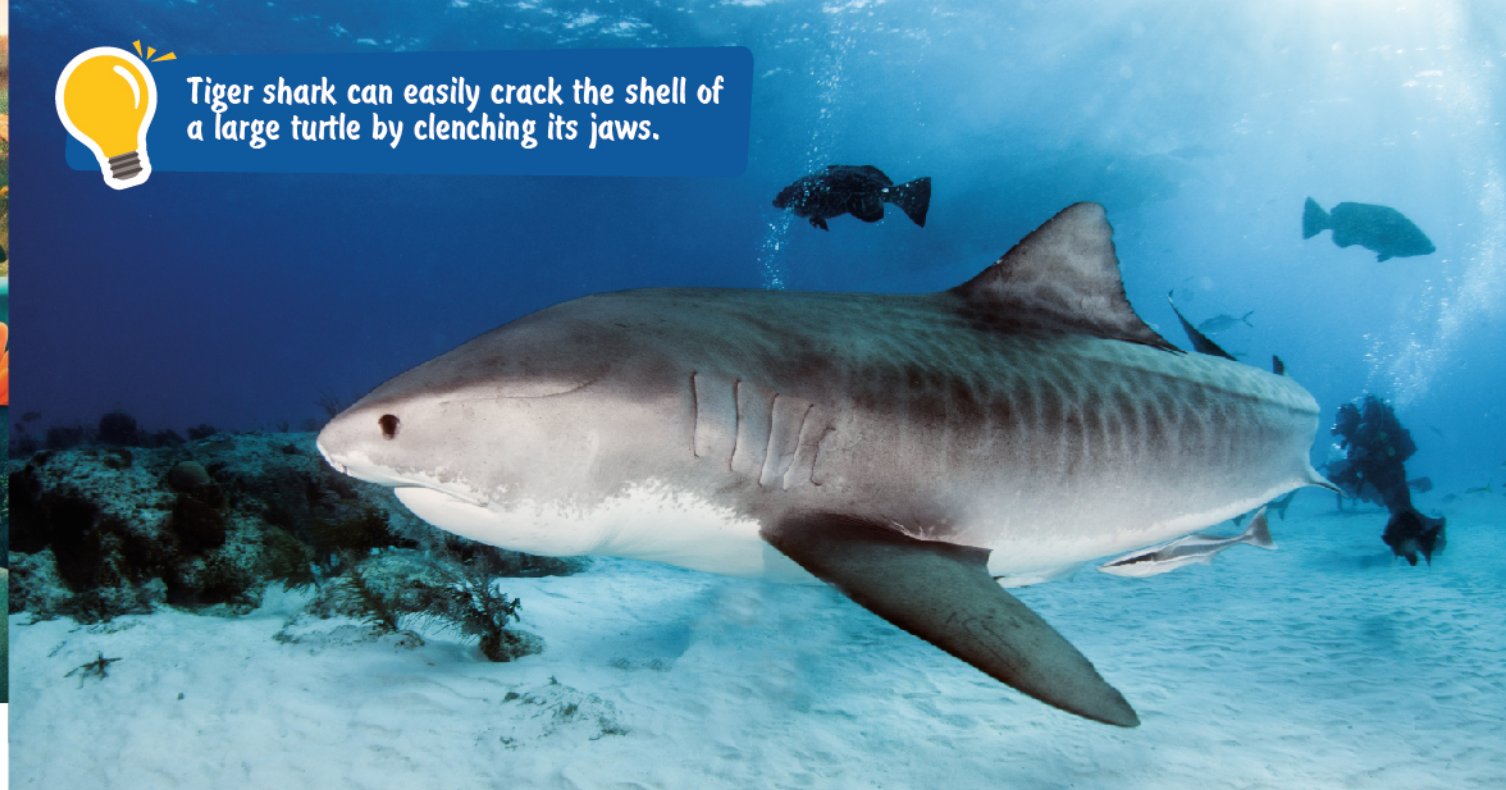

TIGER SHARK

#Jabbaram

KIDDISVIT

Tiger shark can easily crack the shell of a large turtle by clenching its jaws.

TIGER SHARK

Tiger shark is a dangerous underwater creature.

It is called a tiger shark because of the dark stripes on its body, which become less noticeable with age. The shark has a huge mouth with numerous sharp teeth. It has excellent eyesight, but relies on other senses to hunt.

The shark travels up to 80 kilometers a day, and stops only to eat. It feeds on everything that seems edible to it. Along with fish, turtles, and crocodiles, even bottles and gasoline cans can be found in its stomach.

STARFISH

#boobam

KIDDISVIT

Despite the fact that starfish live underwater, they do not have gills.

STARFISH

Starfish is a slow-moving animal with five rays.

The color range of this species includes almost all colors, but the most common are red, yellow, blue, and purple starfish. Their surface can also vary: smooth, spiky, and prickly.

All starfish are mostly bottom-dwelling creatures, they crawl along the bottom surface or bury themselves in the sand. They live in oceans and seas to a depth of 8.5 km. They feed on various small organisms: mollusks, crabs, and other invertebrates.

SIZE:

LEATHERBACK
TURTLE

#JooBam

KIDDISVIT

They are able to swim at a speed of 35 km/h,
but on land they move at a speed of 15 km/h.

LEATHERBACK TURTLE

Leatherback turtle is the largest living turtle.

The maximum length of its body can reach 2.6 m, and its weight — 900 kg. The shell is not connected to the skeleton — it consists of small bone plates connected to each other. The shell is covered with thick dark brown or black-brown skin on top. The head is very large and does not retract under the shell.

Turtle is common in all tropical seas, sometimes swimming to northern waters. It feeds on shellfish, mollusks and some types of seaweed.
